

Modeled Time and Reliability Tell the Same Structural Story

Upper-left means shorter estimated duration and higher estimated success

Evidence class: offline proxy model using fixed timing and error assumptions; not measured device speed or fidelity.

- QUESTION — Under the documented proxy assumptions, how do estimated time and success move together?
- READ — Better modeled outcomes sit toward the upper-left: less time and a higher success estimate.
- RESULT — The trapped-ion proxy is upper-left of the superconducting proxy for every tested matched circuit.
- WHY IT MATTERS — Routing overhead affects more than one count; it propagates into modeled duration and error exposure.
- BOUNDARY — These estimates depend on fixed proxy assumptions and are not calibration-based physical measurements.
